

Definitions of Practical Terminologies

Chapter 11 File Management	
Generic file format	when files are saved in that format they can be used in different types of application software
Comma separated values CSV	◦ Data saved in the form of tables ◦ Items separated by commas ◦ Saved in text format
Text .txt	◦ No font formatting ◦ Used by many text editors ◦ No images ◦ No bulleted lists ◦ Takes less memory than .rtf files
Rich text format .rtf	◦ Readable by most word processing software ◦ Bullet lists and images can be inserted ◦ Some formatting is saved
Graphics interchange format .gif	◦ Stores still or moving images ◦ Small file size ◦ Used in webpages
Joint photographic expert group .jpg	◦ Stores still images only ◦ Small file size ◦ Used in webpages
Portable document format .pdf	◦ Document is converted into image format ◦ Used to protect documents ◦ Can contain links and buttons
Portable network graphics .png	◦ Compresses images without losing their quality (lossless compression)
Moving picture experts group layer 4 .mp4	◦ Multimedia container ◦ Stores video, images, audio files
Moving picture experts group layer 3 .mp3	◦ Compressed files ◦ Stores audio files ◦ Small file size with good quality
Cascading stylesheet .css	◦ File is attached to web page ◦ Defines the page color scheme, font, ...etc
Hypertext markup language .htm	◦ Contains markup to be displayed as a web page by web browsers
Rochal archive .rar	◦ A container that holds any file type in compressed format - Used to reduce number of bytes needed to save a file
Zip	◦ A container that holds any file type in compressed format - Used to reduce number of bytes needed to save a file
Resize	Change image dimensions
Resample	Changing quality/resolution of images
Compress	Decrease the size of a file
Chapter 12 Images	
Text wrap	How the text flows around images/tables

Aspect ratio	the ratio of the width to the height of an image
Crop	Remove part of an image
Rotate	Turn the picture about its center clockwise or anticlockwise
Reflect	Flipping an image
Pixel	the smallest unit of a digital image that can be displayed and represented on a digital display device.
Resolution	Number of pixels per inch
Color depth	the number of bits used to indicate the color of a single pixel
Brightness	the overall lightness or darkness of the image
Contrast	- Contrast is the difference between darks and lights. - When increasing contrast, you make the darks darker and the brights brighter

Chapter 13 Layout

Header	This is an area at the top of every page/ between the top of the page and the top margin
Footer	This is an area at the bottom of every page/ between the bottom of the page and the bottom margin
Page margin	the area between the main content of a page and the page edges
Gutter	A margin between the page margin and the fold of a book

Chapter 14 Styles

Corporate house style	A set of rules which state how all documents and written communication from a business should be formatted. It will govern things such as - the colours to be used - the font style and size - where the logo should appear.....etc
Purpose of house style	- Used to make sure that all the documents and other material have consistency - Saves time in planning , creating and formatting documents - Supports brand recognition - Reduces the risk of mistakes in documents

Chapter 15 Proofing

Validation	Checking that the data entered is reasonable/satisfies certain criteria
Proofreading	Making sure that produced document is accurate in terms of spelling, punctuation, grammar, correct application of styles, no split lists, no split tables, no widows,...etc
verification	A way of preventing errors when data is copied from one medium to another. - Visual verification - Double data entry

Chapter 16 Graphs and Charts

Pie chart	Compare percentage values/ compares part of a whole
Bar chart	shows comparisons among discrete categories. One axis of the chart shows the specific categories being compared, and the other axis represents a measured value.

Line graphs	used to visualize a trend in data over intervals of time
Chapter 17 Document Production (Word)	
Page orientation	is the way in which a rectangular page is oriented for normal viewing.
Margins	The distance between the text and the edge of the page
Widow	When the last line of the paragraph is the first line of a new page
Orphan	When the first line of the paragraph is the last line of a page
Page break	This forces the text onto the start of a new page
Section break	change the layout or formatting of a page or pages in your document Two types: Next page: Forces a page break as well as change in layout Continuous: Allows different layout on the same page
Column break	This forces the text into the top of the next column
Indented paragraphs	Text/lines in paragraph are being moved to the right
Hanging paragraphs	The first line of the paragraph is aligned to the margin. All the other lines are moved/indented to the right
Mail merged document	the automatic addition of names and addresses and information from a data source to letters and other documents in order to facilitate sending mail to many addresses.
Advantages of mail merge	- Faster than editing each individual letter - Fewer errors than retyping the data - Consistency in the reports/emails - Error checking only needs to be carried out once (on the data and the Template(master document)) - Reduces the time taken to write out all the reports/emails separately
Chapter 18 Data Manipulation (Access)	
Field	A single item of data
record	Collection of fields
File	An organized collection of records, can have one or more tables
Flat-file database	All the data is stored in one table
Relational database	Stores data in more than one linked table, each table will have a key field
Primary key	A field that holds unique data and is used to identify a record
Foreign key	It is defined in a second table, but it refers to the primary key in the first table.
Alphanumeric	store alpha characters (text) or numeric data (numbers)
Numeric	used to store numeric values that may be used for calculations
Boolean	field type is used to store data in a Yes/No (or True/False,0/1) format
Chapter 19 Presentations (Powerpoint)	
Master slide	• slide allows you to design the layout of your slides before you start adding objects (like text or images) to the slides. • It holds the information on colours, fonts, effects and the positioning of objects on the slides. • All the objects placed on the master slide will automatically appear on all the slides in your presentation
Animation	a set of effects which can be applied to objects
Transition	motion effects that when in Slide Show view add movement to your slides as you advance from one slide to another

Presenter notes	A copy of slides with key facts that need to be told to the audience by the person delivering the presentation
Audience notes	Paper copies of the slides that are given to the audience
Chapter 20 Data Analysis (Excel)	
Data model	A data model is used to mimic real situations. Data are entered into tables (spreadsheets) and are manipulated and analyzed
Cells	The intersection of a row and a column Each cell has its own cell address/reference
Rows	Row runs horizontally . Each row is identified by row number (1,2,3,...)
Columns	Column runs vertically, identified by column header (A,B,...)
Worksheet	A set of rows and columns. It is possible to have more than one within the same workbook(spreadsheet file)
Tabs	worksheet tab is used to display the worksheet that a user is currently editing
charts	graphic representation of data
Formula	- A formula is a statement / equation typed in by the user to be calculated. - A formula can contain values/references to cells/defined names. - Examples =A1+B1 .
Function	- A function is a piece of code designed to return specific values. - Pass parameters/variables to functions - Function has a pre-defined name in the software. - They are used inside formulas. - Examples SUM()/AVERAGE()
Absolute reference	Cell address/ references remain constant, no matter where they are copied.
Relative reference	Cell address/ references change when a formula is copied to another cell.
Ranges	A group of cells in a worksheet that has been selected or highlighted.
Named cell	A short meaningful name given to a cell in the spreadsheet that is going to be used a number of times within a formulae
Named range	A short meaningful name given to an area in the spreadsheet that is going to be used a number of times within a formulae
Nested formula/function	Having one formula or function inside another one
Testing	Making sure the model produces the required output for data where the correct output is already known
Test data	Data which has been specifically identified for use in tests, to verify that a given set of input to a given function produces some expected result
Expected outcome	Result expected to get after test data is provided
Actual outcome	Actual result produced after test data is provided
Normal data	Data expected to work with formulas, within the range
Abnormal data	Data not expected to be accepted, outside the range
Extreme data	Lies on the boundaries of a range
Chapter 21 Website Authoring (Frontpage)	
Web development layers	Content Layer This is the web page you see. It consists of text and images Presentation Layer This is how the document will look to the reader (ie the format done to the objects on the web page)

	• Behaviour Layer This is the layer that does some action when the user clicks on an object
Hyperlink	is a reference to data that the reader can directly follow either by clicking, tapping, or hovering. A hyperlink points to a whole document or to a specific element within a document
