

Computer Models/Simulation

It is the process of imitating (copying) the behavior of real phenomenon/object with the help of mathematical formulae using computer

Situations that can be modeled/application of computer model

- Flight Simulator
- Nuclear reaction
- Chemical reactions
- Car Design
- Building design
- Car accidents
- Car traffic
- Car Driving simulation
- Financial models(Spread sheet)

Why computer models are used rather than real model? OR Why some situations are modeled? OR Advantages of using computer models rather than using real models

- Computer models are inexpensive to design
- Results are obtained faster
- Computer models are easy to alter or edit
- Can prevent wastage of materials
- Can create several versions of a model
- To prevent risks/dangers to life
- Can create unattainable environments
- Can test different situations

Disadvantages of using Computer Models

- Equipment to design models is expensive
- Need to hire experts
- Need to pay more to experts
- Computer model may not be accurate as real models

Name the Situation that are modeled to prevent risks.

- Flight simulator
- Chemical reactions
- Nuclear reactions
- Car accidents
- Building designs
