

Microprocessor Controlled Washing machine

Answer:

INPUT: Change in the value of Temperature, Moisture and Pressure is sensed by the sensors.

PROCESSING: After the values are changed to digital using ADC. Microprocessor will compare the values sensed by sensors with the preset/normal values stored.

e.g IF Temperature is more than normal/preset then turn OFF heater Else ON

IF Pressure is more than normal/preset value then turn OFF water supply Else ON

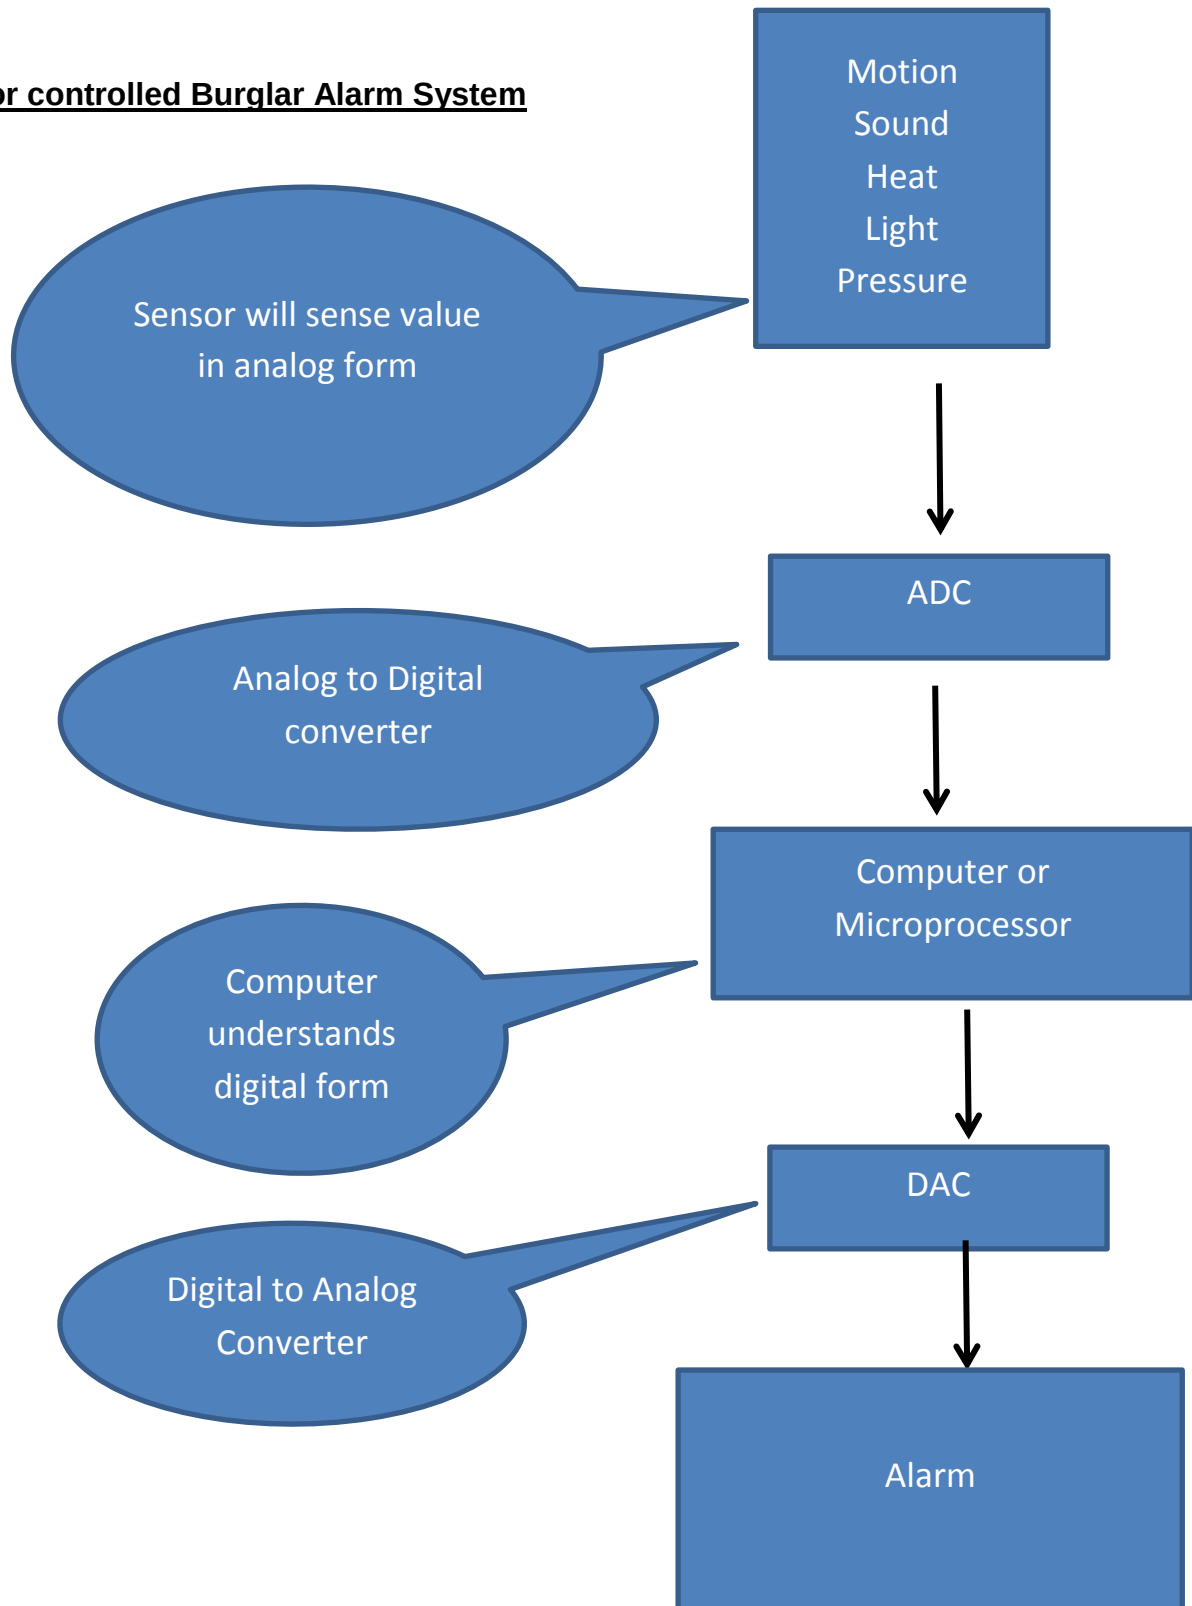

IF Moisture is more than normal/preset value then turn ON heater Else OFF

OUTPUT: Heaters turn ON or OFF to maintain water temperature

Water supply turns ON or OFF to control level of water

Heater turn ON or OFF to maintain moisture level

Microprocessor controlled Burglar Alarm System

Answer:

INPUT: Change in the value of Pressure, Light and Sound/Motion is sensed

PROCESSING: After the values are changed to digital using ADC. Microprocessor will compare the values sensed by sensors with the preset/normal values stored.

e.g IF Pressure is more than normal/preset then turn ON Alarm Else OFF

IF sound is more than normal/preset value then turn ON Alarm Else OFF

IF the light beam breaks the sensors sense no light so Alarm turns ON else OFF

OUTPUT: Alarm turns ON or OFF or a signal is sent to the Police
